

Water Utilities Holding Consumers to Ransom

If you at home or at work are forced to use expensive alternatives to municipal water, then you are being held to ransom. Rand Water Board (RWB) in Gauteng is doing just that. Due to poor planning and an even poorer execution of its mandate, RWB is increasingly unable to deliver the quantity and more importantly the quality of water that the growing population in Gauteng requires to live on. As a result, bottled water sales have rocketed, and reduced many businesses' and individuals' discretionary spend.

Recent headlines include the following:

- Water levels remain low: Rand Water
- When spokesmen are afraid to speak, assume the worst
- Is Rand Water safe?
- Tsakane community grinds to halt after water shortage
- Gauteng taps to remain dry for now

These are all indictments on Rand Water, and are set to remain.

Are you prepared to continue under such a situation, or do you want to unshackle yourself?

Atmospheric Water Generation – A Viable Alternative

Cirrus Water Management provides equipment that produces an unlimited supply of high-quality drinking water, where it is needed, that has an extremely low impact on the environment whilst being cost effective, as an alternative to any other source of drinking water. The equipment achieves this by extracting water out of the atmosphere where there is always a supply of humidity.
